SomethingTODO.

## WHAT TODO LIST IS

Something TODO is simple an easy to use application for managing your ToDO list.

## HOW TO USE!

You can create/modify/remove items for your list

- for creating a new item you must click in the + button on the top left of the screen.
- to modify an item you want to click in the row of that item, a new view will appear where you can modify the existing data of that item.
- to delete an item you need to swipe from the right to the left of the item's row. and click on DELETE
- for marking an item as a completed you need to swipe with your finger from left to right of the item's row.

## APPROACH

When I started to read the task spec and when I was thinking about how to solve the problem with the sync and persistency I realized that it would be cool that the app also read the reminders that I already had in my reminder's app.

with this approach I wouldn't have two application in iOS with some different todo items, I use also the reminder app in MAC so I wanted to have my todo list items there as well.

I took advantage of the EKKit Framework for iOS that provides persistency and synchronization as the task spec mentioned.

but either way I have another sample project using core-data and fetching data from a website : <https://afn1983@bitbucket.org/afn1983/bbc-news-reader.git>
